

ABSTRACT OF THE DISCLOSURE

A system is provided that enables images read by an image data reading apparatus 10 shared by photographing apparatuses 2A~2D to be confirmed without confusion. Information registration terminals 3A~3D for registering sheet identification information I in relation to patient information K are installed together with corresponding monitors 4A~4D, for the respective photographing apparatuses 2A~2D. The terminals, the monitors and the image data reading apparatus 10 are connected to a network 15. One of the terminals 3A registers the patient information K and the identification information I of a sheet used for photographing by the corresponding photographing apparatus 2A, and the image data reading apparatus 10 reads image data S from the sheet. The image data S are transferred automatically to the monitor 4A corresponding to the terminal 3A that registered the information, and a visible image of the image data S is displayed on the corresponding monitor 4A.
